EOI	FF D9

JFIF APP0 marker segment [edit]

In the mandatory JFIF APP0 marker segment the parameters of the image are specified. Optionally an uncompressed

JFIF APP0 marker segment		
Field	Size (bytes)	Description
APP0 marker	2	FF E0
Length	2	Length of segment excluding APP0 marker
Identifier	5	4A 46 49 46 00 = "JFIF" in ASCII, terminated by a null byte
JFIF version	2	First byte for major version, second byte for minor version (01 02 for 1.02)
Density units	1	Units for the following pixel density fields <ul style="list-style-type: none">00 : No units; width:height pixel aspect ratio = Xdensity:Ydensity01 : Pixels per inch (2.54 cm)02 : Pixels per centimeter
Xdensity	2	Horizontal pixel density. Must not be zero.
Ydensity	2	Vertical pixel density. Must not be zero.
Xthumbnail	1	Horizontal pixel count of the following embedded RGB thumbnail. May be zero.
Ythumbnail	1	Vertical pixel count of the following embedded RGB thumbnail. May be zero.

What is a picture?

Is it possible to create an image which executes code?

- ★ **Yes**
- ★ If this is intentional, it's a feature
- ★ If this is not intentional, the picture is an exploit (exploiting a bug/vulnerability)

How?!

- ★ Make the original program (code) execute our (the attackers) own code (data) by writing into memory locations at runtime which influence where code is being read from

Vulnerability types

Vulnerability types

Vulnerability types

- ★ **Memory corruption**
- ★ Authentication
- ★ Authorization
- ★ Configuration error
- ★ Input validation
- ★ Logic error
- ★ Sensitive data protection
- ★ Session management
- ★ Encoding Error
- ★ Cryptographic Errors
- ★ Permission Problems
- ★ ...

Vulnerability Types

Memory corruption occurs in a computer program when the **contents of a memory location are unintentionally modified** due to programming errors; this is termed violating memory safety. When the corrupted memory contents are used later in that program, **it leads either to program crash or to strange and bizarre program behavior**

Modern programming languages like C and C++ have powerful features of explicit memory management and pointer arithmetic. These features are designed for developing “efficient” applications and system software.

https://en.wikipedia.org/wiki/Memory_corruption

Vulnerability Types – Memory Corruption

Memory corruption: Overwrite adjacent bytes (but in memory)

What is an exploit?

Formal definition

What is an exploit? Dictionary

Simple Definition of EXPLOIT

- ★ to get value or use from (something)
- ★ **to use (someone or something) in a way that helps you unfairly**

Full Definition of EXPLOIT

- ★ to make productive use of : UTILIZE
<exploiting your talents>
<exploit your opponent's weakness>
- ★ to make use of meanly or unfairly for one's own advantage
<exploiting migrant farm workers>

<http://www.merriam-webster.com/dictionary/exploit>

What is an exploit? Hacking related

to exploit (v): To take advantage of a vulnerability so that the target system reacts in a manner other than which the designer intended.

the Exploit (n): The tool, set of instructions, or code that is used to take advantage of a vulnerability.

(The Shellcoders Handbook, 2nd Edition, p4)

What is an exploit?

```
1  /*
2  **
3  ** wu-ftp v2.6.2 off-by-one remote 0day exploit.
4  **
5  ** exploit by "you dong-hun"(Xpl017Elz), <szoahc@hotmail.com>.
6  **
7  ** Update:
8  **      [v0.0.2] August 2, I added wu-ftp-2.6.2, 2.6.0, 2.6.1 finally.
9  **      [v0.0.3] August 3, Brute-Force function addition.
10 **      [v0.0.4] August 4, Added FreeBSD, OpenBSD version wu-ftp-2.6.x exploit.
11 **                  It will be applied well to most XxxxBSD.
12 **      [v0.0.5] August 4, Remote scan & exploit test function addition.
13 **                  August 6, Cleaning.
14 **

Types of exploits?

Local, remote, client-side exploits

Trusted Computing

Only trusted
apps (code)
running

Computer
fully secure

Trusted Computing

Virus /
Backdoor /
Trojan /
Malware

Is **NOT**
Exploit

Trusted Computing

Introduce
new code
into running
software

Types of exploits

Local

Server-side

Client-side

Types of exploits - **Local** exploit

Types of exploits - **Local** exploit

Local Exploit:

- ✦ Attacker is already on a host (has code execution on the computer / cpu)
- ✦ Wants to execute his code with higher privileges
- ✦ “Privilege Escalation”

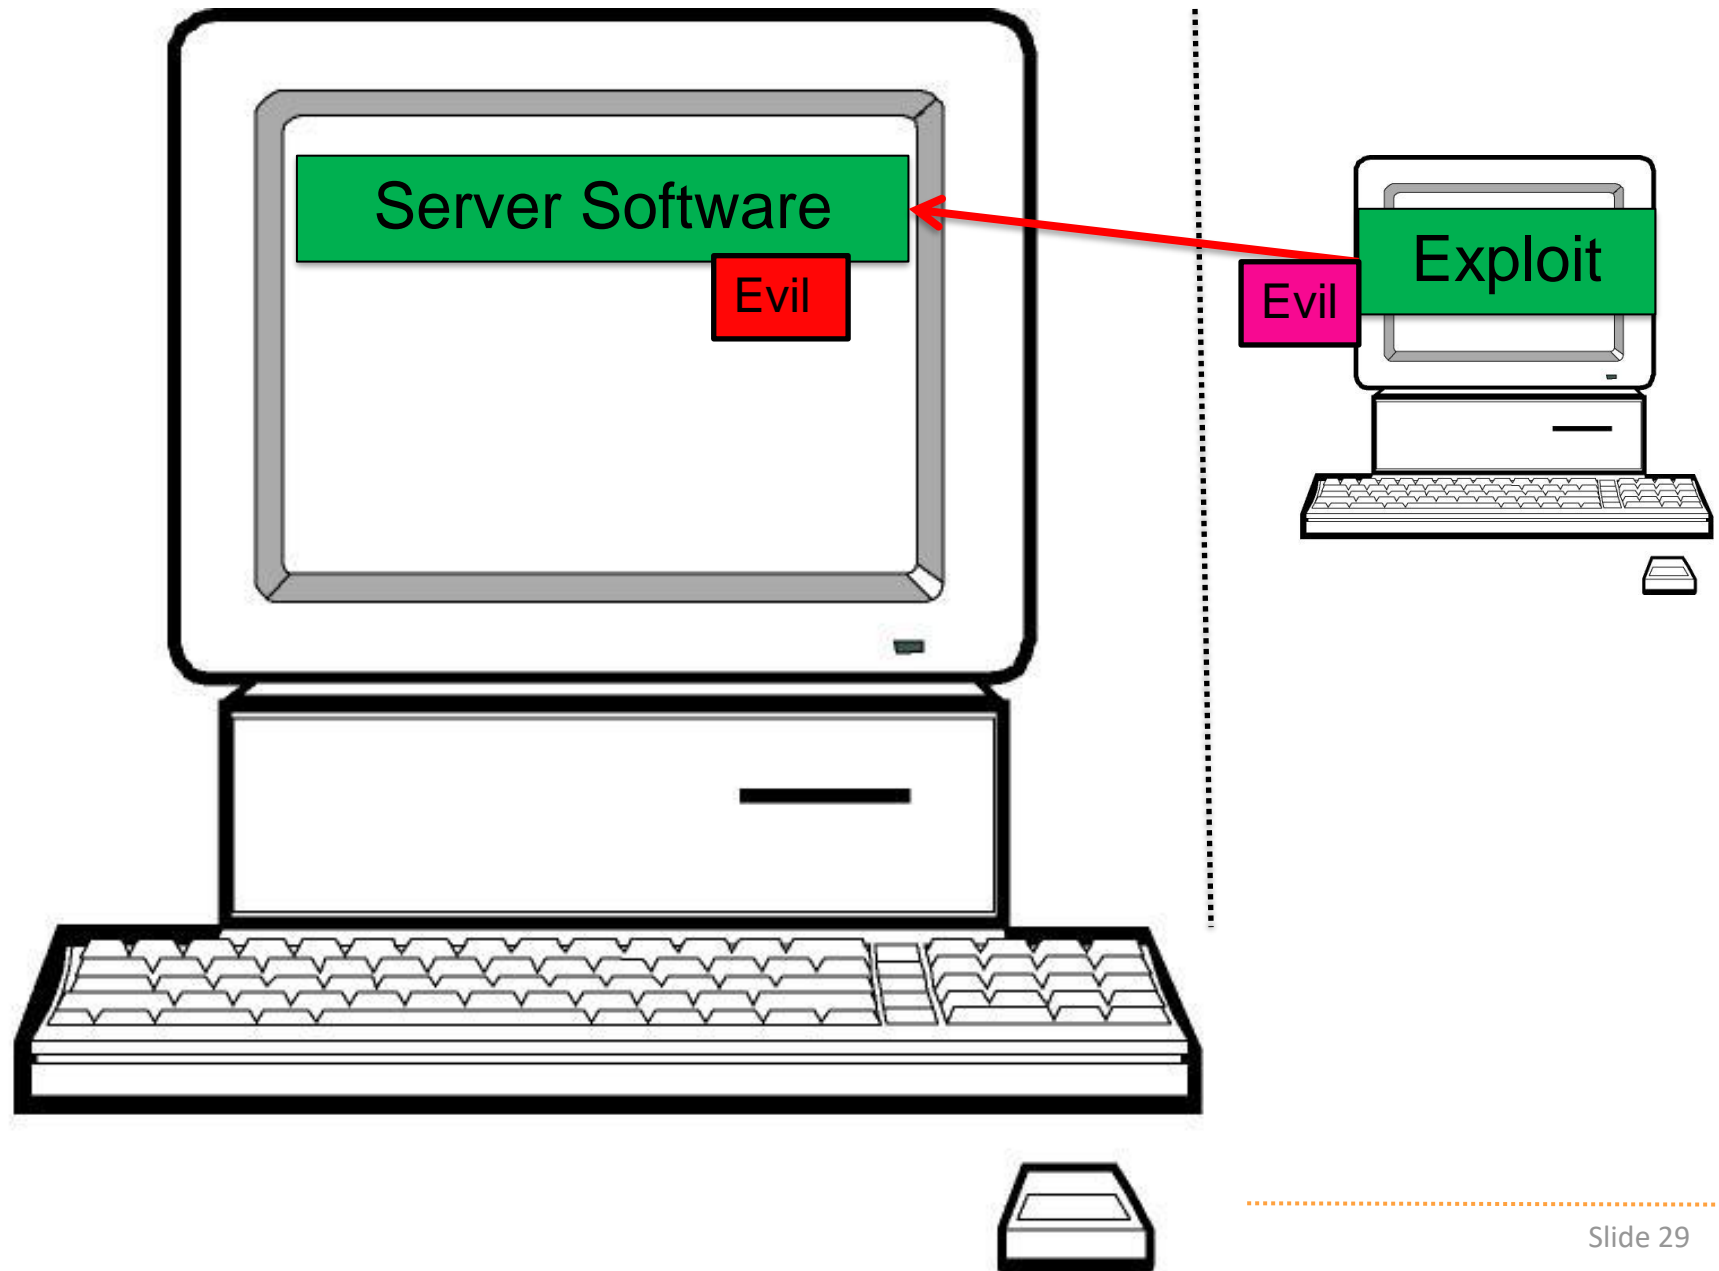

Linux:

- ✦ User -> root
- ✦ E.g.: www-data -> root

Windows:

- ✦ User -> Local Admin (-> System)

Types of exploits - **Server-side / remote exploit**

Types of exploits - **Server-side / remote exploit**

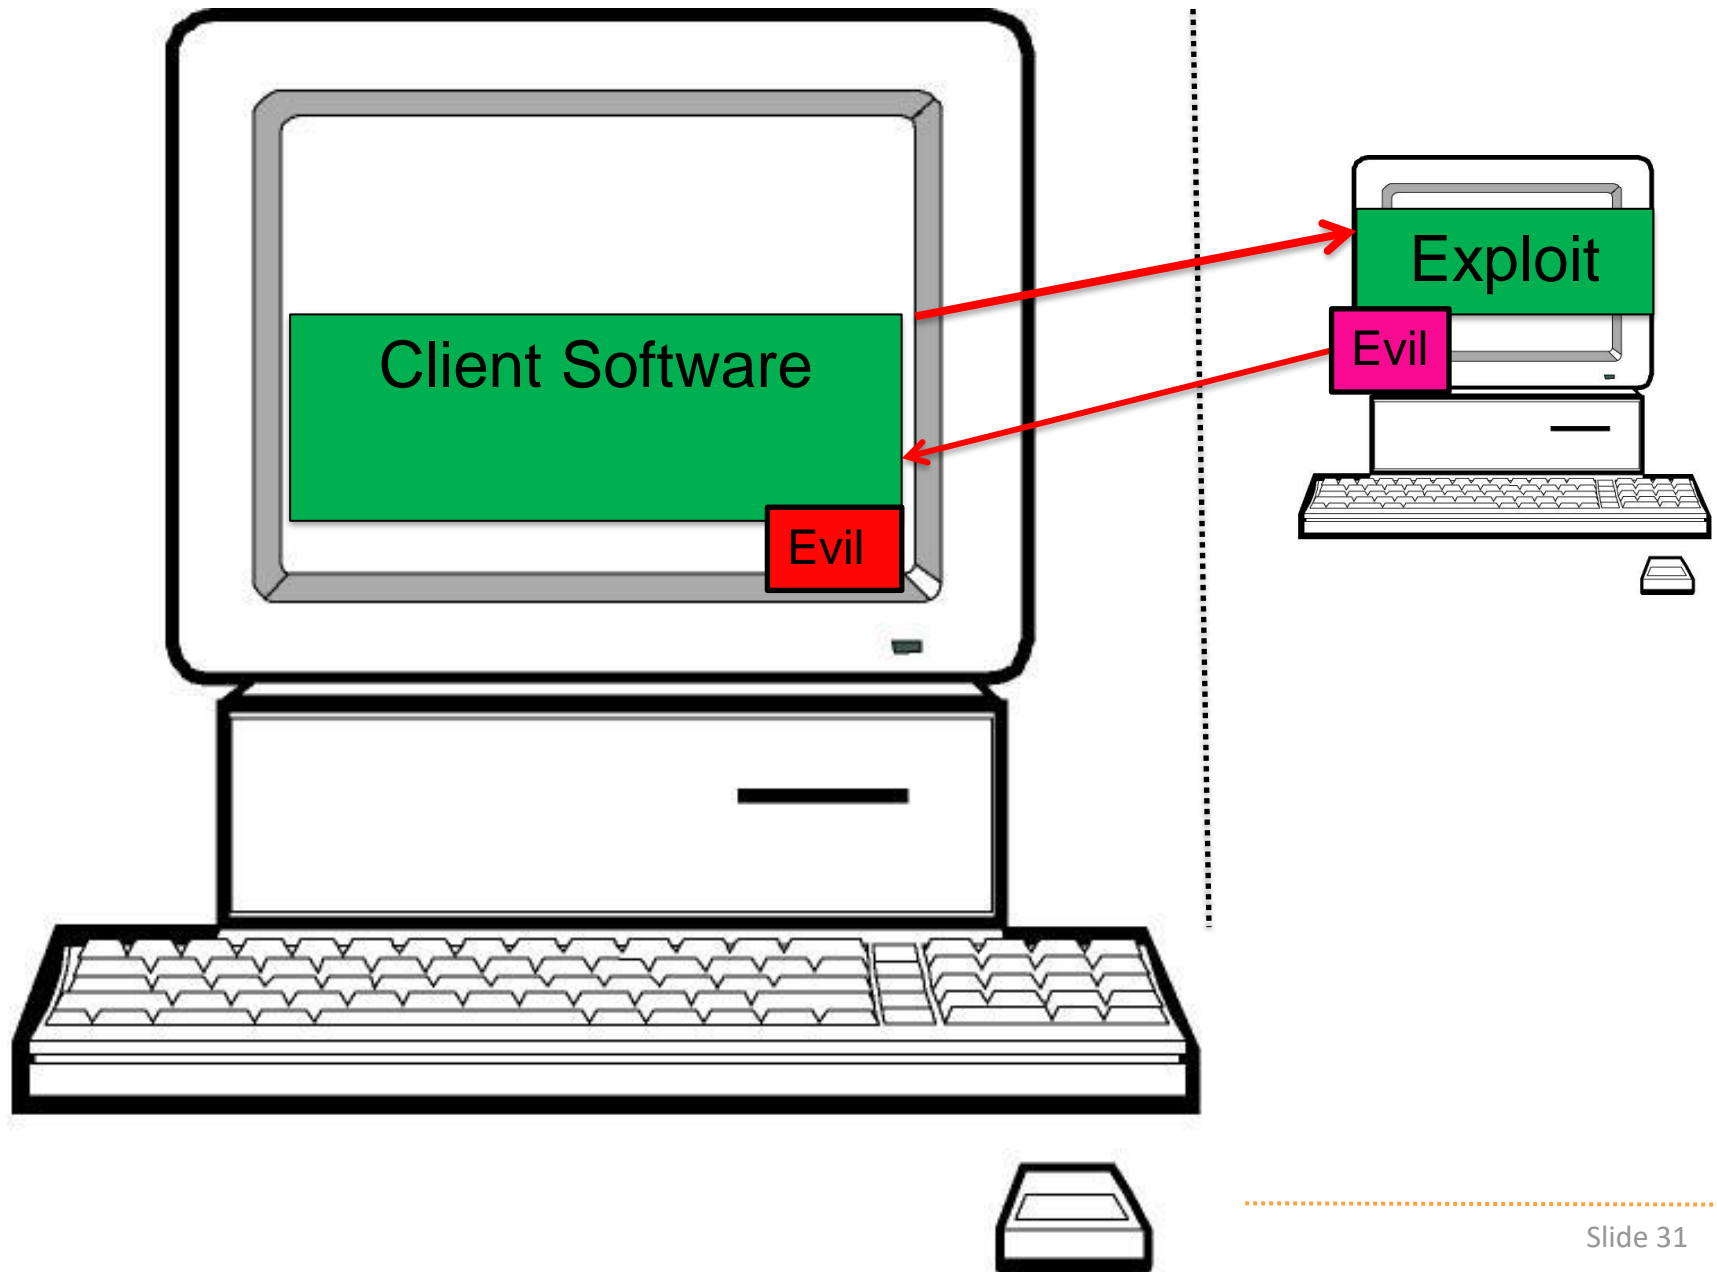

Remote Exploit:

- ✦ Attacker can directly talk with a server software on a host
- ✦ Wants to execute his code on the remote host

Server Examples

- ✦ FTP Server (proftp, wuftp)
- ✦ DNS Server (bind)
- ✦ Web Server (IIS, Apache)

Types of exploits - **Client-side** exploit

Types of exploits - **Client-side** exploit

Client Exploit:

- ★ Attacker can influence data which a client receives
- ★ Wants to execute his code on the client host

Examples:

- ★ Browser
 - ★ Flash
 - ★ Java
 - ★ Image Viewer
- ★ Word
- ★ Putty
- ★ Git
- ★ VLC

What is vulnerable against memory corruption?

What is vulnerable?

What software is affected?

Software developed in unsafe programming languages

- ★ (ASM)
- ★ C
- ★ C++
- ★ Fortran (lol)

What is vulnerable?

What software is affected?

Software developed in unsafe programming languages

- ✦ (ASM)
- ✦ C
- ✦ C++
- ✦ Fortran (lol)

Who writes software in C/C++, anyway?

- ✦ IE, Chrome, Firefox
- ✦ Apache / IIS
- ✦ Postfix, Sendmail
- ✦ BIND
- ✦ MS Office / LibreOffice
- ✦ Antivirus
- ✦ Other “Security” Software

What is not vulnerable?

Not affected:

Software written in interpreted languages

- ✦ PHP
- ✦ Perl
- ✦ Ruby
- ✦ Bash
- ✦ Python
- ✦ JavaScript

Languages with memory safety

- ✦ Rust
- ✦ C#
- ✦ Java
- ✦ Go

Exception: Native calls

What is vulnerable?

Special case: Interpreter itself

What language is PHP, Java, JavaScript, ... written-in?

- ★ C / C++ !

Some memory corruption vulnerability examples

From 2015

What is vulnerable?

Vulnerability Details : [CVE-2015-8617](#)

Format string vulnerability in the zend_throw_or_error function in Zend/zend_execute_API.c in PHP 7.x before 7.0.1 allows remote attackers to execute arbitrary code via format string specifiers in a string that is misused as a class name, leading to incorrect error handling.

– CVSS Scores & Vulnerability Types

CVSS Score	10.0
Confidentiality Impact	Complete (There is total information disclosure, resulting in all system files being revealed.)
Integrity Impact	Complete (There is a total compromise of system integrity. There is a complete loss of system protection, resulting in the entire system being compromised.)
Availability Impact	Complete (There is a total shutdown of the affected resource. The attacker can render the resource completely unavailable.)
Access Complexity	Low (Specialized access conditions or extenuating circumstances do not exist. Very little knowledge or skill is required to exploit.)
Authentication	Not required (Authentication is not required to exploit the vulnerability.)
Gained Access	None
Vulnerability Type(s)	Execute Code
CWE ID	134

Some memory corruption bugs

CVE-2015-6094

- ✦ Microsoft Office is prone to a remote memory-corruption vulnerability because it fails to properly handle objects in memory.
- ✦ **Excel 2010, 2013, 2016**

CVE-2015-6068

- ✦ Microsoft Internet Explorer is prone to a remote memory-corruption vulnerability. Attackers can exploit this issue by enticing an unsuspecting user to view a specially crafted webpage.
- ✦ **IE11**

CVE-2015-5122

- ✦ Use-after-free vulnerability in the DisplayObject class in the ActionScript 3 (AS3) implementation in Adobe Flash Player 13.x through 13.0.0.302 on Windows and OS X, 14.x through 18.0.0.203 on Windows and OS X, 11.x through 11.2.202.481 on Linux, and 12.x through 18.0.0.204 on Linux Chrome installations allows remote attackers to execute arbitrary code
- ✦ **Flash 11, 12, 13, 14**

Some memory corruption bugs

CVE-2015-0287

- ✦ ASN.1 structure reuse memory corruption. Reusing a structure in ASN.1 parsing may allow an attacker to cause memory corruption via an invalid write.
- ✦ **OpenSSL 0.9.8-1.0.2**

CVE-2015-7852

- ✦ A potential off by one vulnerability exists in the cookedprint functionality of ntpq. A specially crafted buffer could cause a buffer overflow potentially resulting in null byte being written out of bounds.
- ✦ **NTP 4.2.8p2**

CVE-2015-1538 (Stagefright)

- ✦ Integer overflow in the SampleTable::setSampleToChunkParams function in SampleTable.cpp in libstagefright in Android before 5.1.1 LMY48I allows remote attackers to execute arbitrary code via crafted atoms in MP4 data that trigger an unchecked multiplication
- ✦ **Android 1.5 - 5.1**

Some memory corruption bugs

Programs and Data

Definition of a “program”:

“A program is a set of instructions
which modifies data”

Definition of a “program”:

“A program is a set of instructions
~~which modifies data~~
which is controlled by data”

Programs and Data

Definition of a “program”:

“A program is a set of instructions
~~which modifies data~~
which is controlled by data”

Or in other words:

Data is manipulating the instruction
flow of a program,
not the other way round

Weird machines

Weird machines:

In computer security, the weird machine is a computational artifact where additional code execution can happen outside the original specification of the program.

It is closely related to the concept of **weird instructions**, which are the **building blocks of an exploit based on crafted input data**.

Programming of “Weird Machines”

Gain very detailed understanding of:

- ✦ Program logic
- ✦ Implementation of “hidden mechanics”
 - ✦ Stack, Heap etc.
- ✦ Error conditions

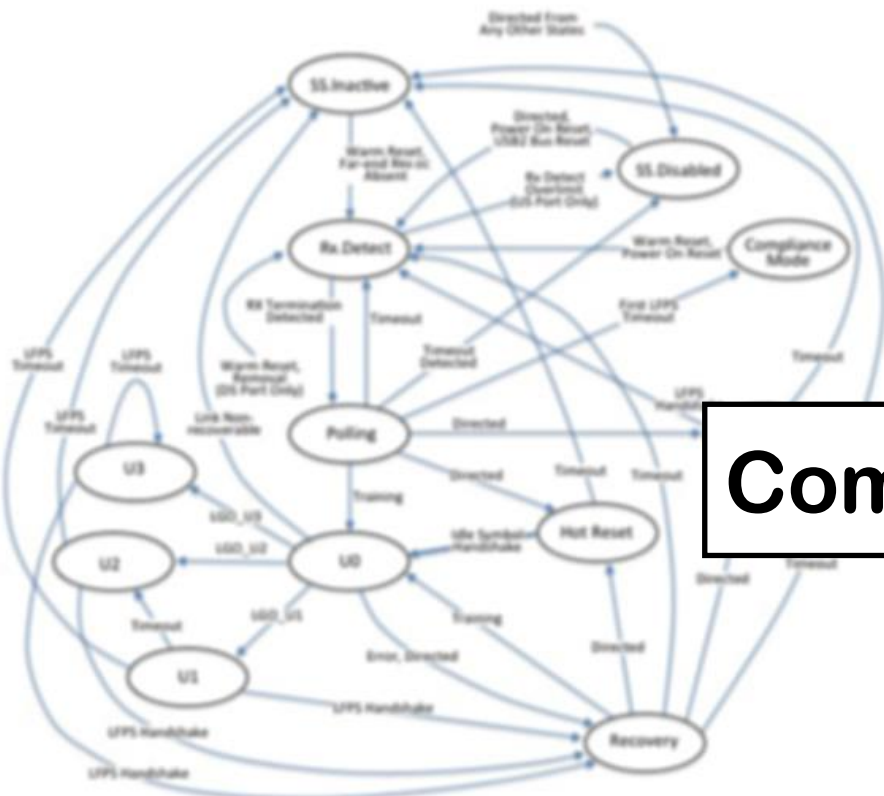

Leads from from:

- ✦ “This bugs randomly crashes my program!”

To:

- ✦ “This bugs lets me reliably execute arbitrary code”

What are memory corruption bugs doing?

Compile

Software:

- ★ Important software is written in **C/C++**
- ★ Memory corruption bugs are (still) very, very prevalent
- ★ We are concerned with **memory corruption vulnerabilities**
 - ★ Modify memory in a program which should not be possible
- ★ A program which misuses a memory corruption vulnerability is called an **exploit**
 - ★ There can be local-, server- and client exploits
- ★ A exploit injects **additional code** into a trusted app and executes it
- ★ For attacker, **data influences execution of code** (weird machines)

Is exploit writing hacking?

Is exploit writing hacking?

Hack

1. to cut, notch, slice, chop, or sever (something) with or as with heavy, irregular blows (often followed by *up* or *down*):

to hack meat; to hack down trees.

Is exploit writing hacking?

An aspect of hack value is performing feats for the sake of showing that they can be done, even if others think it is difficult. **Using things in a unique way outside their intended purpose** is often perceived as having hack value.

Examples:

- ✦ using a dot matrix impact printer to produce musical notes
- ✦ using an optical mouse as barcode reader.
- ✦ making soup with your coffee machine

https://en.wikipedia.org/wiki/Hacker_culture

Is exploit writing hacking?

hack: *Computers.*

to modify (a computer program or electronic device) or write (a program) in a skillful or clever way:

Developers have hacked the app.

I hacked my tablet to do some very cool things.

to circumvent security and break into (a network, computer, file, etc.), usually with malicious intent:

Criminals hacked the bank's servers yesterday.

Our team systematically hacks our network to find vulnerabilities.

<http://www.dictionary.com/browse/hacking>

Is exploit writing hacking?

Hackerethik:

Freier Zugriff auf Computer

Freier Zugriff auf Wissen

Misstrauen gegenüber Autoritäten und Bevorzugung von Dezentralisierung.

Hacker sollten nur nach ihrer Fähigkeit beurteilt werden.

Du kannst Kunst und Schönheit mittels Computer erzeugen

Verbesserung der Welt durch das Verbreiten von Technologien

<https://de.wikipedia.org/wiki/Hackerethik>

\\The Conscience of a Hacker\\

<http://phrack.org/issues/7/3.html>

Another one got caught today, it's all over the papers. "Teenager Arrested in Computer Crime Scandal", "Hacker Arrested after Bank Tampering"... Damn kids. They're all alike.

I made a discovery today. I found a computer. Wait a second, this is cool. It does what I want it to. If it makes a mistake, it's because I screwed it up. Not because it doesn't like me... And then it happened... a door opened to a world... rushing through the phone line like heroin through an addict's veins, an electronic pulse is sent out, a refuge from the day-to-day incompetencies is sought... a board is found.

This is our world now... the world of the electron and the switch, the beauty of the baud. **We explore... and you call us criminals. We seek after knowledge... and you call us criminals.** We exist without skin color, without nationality, without religious bias... and you call us criminals.

Obligatory history lesson...

Morris worm

Morris worm

- ✦ 02.11.1988
- ✦ Written by graduate student Robert Morris, MIT
- ✦ He wanted to count the number of computers on the internet (~60'000)
- ✦ Worm had a bug, re-infected already infected computers, killed the Internet
- ✦ Attacked fingerd and sendmail (and some more things)
- ✦ One of the first Buffer Overflow (memory corruption) used publicly

Morris worm

fingerd bug in BSD4 on VAX machines:

The bug exploited to break fingerd involved **overrunning the buffer the daemon used for input**. The standard C library has a few routines that read input without checking for bounds on the buffer involved. In particular, the **gets** call takes input to a buffer without doing any bounds checking; this was the call exploited by the Worm.

The Internet Worm Program: An Analysis (2004)
